Acknowledgments

The authors acknowledge the invaluable support received from the Menzies Foundation for generously funding this project.

We would also like to express our gratitude for the support received from the following contributors:

- Liz Gillies, CEO, Menzies Foundation
- Advisory Board: The Hon. Justice Susan Kenny AM, Fiona McLeay, Cheng Lim, Carmel Mulhern, Cameron Whittfield, Peter Collins, Michelle Price
- CAIDE collaborators: Prof. Lars Kulik, Gabby Bush, and Dr. Michael Wildenauer

In addition, the authors express their sincere appreciation to Centre for AI and Digital Ethics, School of Computing and Information Systems, Melbourne Law School, and the University of Melbourne for their unwavering support and collaborative contributions to this research endeavour.

A special acknowledgment goes to all the participants in this project, whose generous allocation of time and valuable insights were indispensable in shaping the meaningful findings of this research. Their dedication has been instrumental in the success of this project.

A. Executive Summary

A. Executive Summary

This report summarises findings from the Ninian Stephen Law Program, 'New Legal Thinking for Emerging Technologies' project, funded by the Menzies Foundation. It assesses the readiness of the Australian legal profession to navigate emerging technologies. Via a series of in-depth interviews and surveys with technology lawyers in Australia, **we found that lawyers are currently ill-equipped to deal with the coming wave of emerging technology.**

This report identifies **gaps in legal skills and organisational structures**, and **outdated perceptions of the role of lawyers** in contemporary organisations. It provides a set of recommendations around education, training and legal involvement in organisational processes.

Further, it underscores the need for a **paradigm shift in how lawyers are perceived**: from lawyers as mere risk identifiers to lawyers as proactive problem solvers that promote high legal and ethical standards in technology adoption.

Due to the rapidly changing digital environment, lawyers are being increasingly asked to offer legal counsel on new technologies. However, anecdotal evidence suggests that many attorneys are facing significant hurdles in offering guidance in this realm.

The difficulties result from two causes: (1) new technology advances more quickly than regulation can keep up; and (2) traditional legal precedent may not apply directly where new technologies are involved.

To keep up with the most recent innovations, **lawyers must continually update their knowledge and their expertise** to stay abreast of the latest developments. Additionally, because emerging technologies can include complicated interdisciplinary challenges, **lawyers must work closely with professionals who understand the underlying technology**, such as artificial intelligence.

We found that lawyers are currently ill-equipped to deal with the coming wave of emerging technology.

A.1. KEY RESEARCH QUESTIONS

The research project was guided by the following key questions:

Q.1.

How do lawyers respond to the risks and opportunities of emerging digital technologies? How could they respond more effectively and what are the gaps in their knowledge and practices preventing this?

Q.2.

What kinds of training and education would assist lawyers in being well-equipped with the required skills for legal and ethical challenges of emerging technology?

Q.3.

What strategies can be employed to optimise collaboration between legal professionals and other internal teams within organisations, with a focus on unlocking the full potential of lawyers?

A.2. METHODOLOGY AND RESEARCH DESIGN

This project employed a mixed-methods approach, incorporating predominantly qualitative research methods, but also quantitative surveys. The research process was conducted in two stages.

In the first stage as qualitative phase of this project, qualitative findings were obtained through semi-structured one-hour-long interviews with 26 in-house lawyers from diverse sectors, including hospitals, banks, cybersecurity firms, law firms, insurance companies, telecommunications, research institutes, law enforcement agencies, business groups and social enterprises.

The primary objective of this stage was to gain an in-depth understanding of the challenges lawyers encounter when dealing with emerging technologies.

The purpose of these interviews was not to capture generalised findings but rather to deliver a rich and detailed exploration of the issues. Upon analysing the data from the qualitative phase, valuable insights were extracted. These insights played a crucial role in shaping the survey questions for the second stage of the project.

During stage two, online surveys were developed using the Qualtrics platform.

These surveys were specifically designed to collect quantitative data from lawyers in Australia who work in either in-house counsel or law firms. Straightforward descriptive analysis methods were used to provide a quantitative representation of the findings.

This approach allowed for a more comprehensive understanding of the issues discussed in the qualitative interviews.

This two-stage approach provided a well-rounded perspective on the challenges lawyers face in the area of emerging technologies.

A.3. LIMITATIONS

Several challenges were experienced during the data gathering process. The main challenges encountered throughout the recruitment process were as follows:

- Identifying in-house lawyers who were willing to participate in interviews.
- Finding interviewees with a strong knowledge of emerging

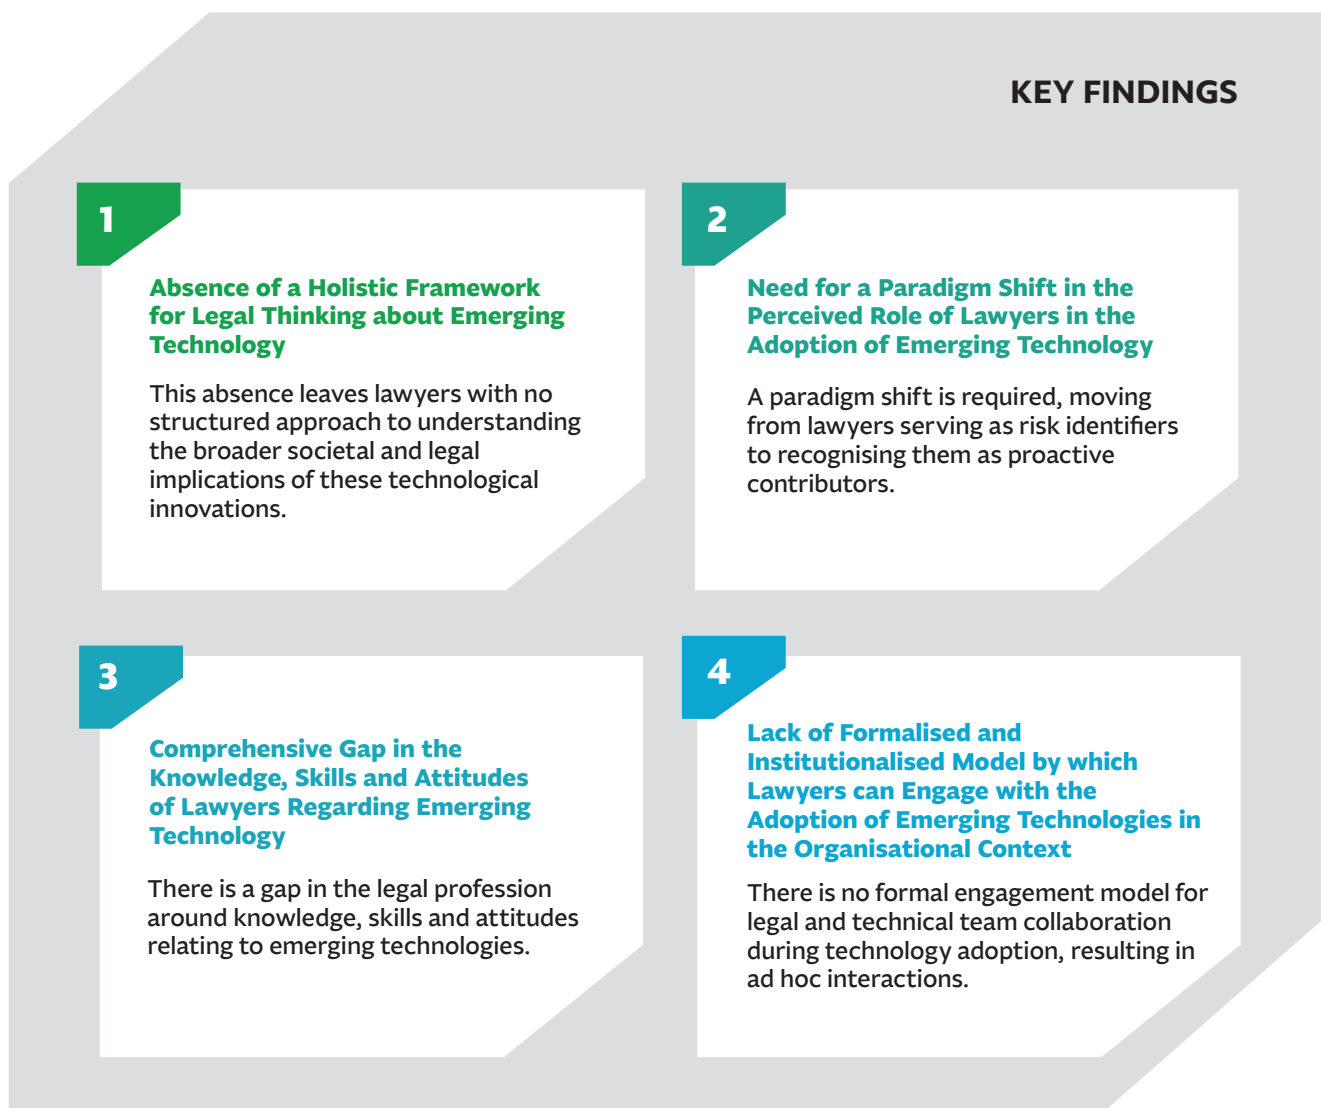

technologies who were sufficiently engaged to confidently discuss the topic.

- Encouraging lawyers to speak openly and freely, especially when the findings indicated tensions between the role of in-house legal counsel and other key stakeholders within their firms.

- Achieving a high number of survey responses, with lawyers often have busy schedules and were hesitant to participate in surveys due to time constraints.

A.4. SUMMARY OF KEY FINDINGS

Based on both qualitative and quantitative data, the key findings from this project include the following:

These findings collectively underscore the need for a fundamental shift in how lawyers approach emerging technologies, emphasising structured frameworks, proactive roles, enhanced knowledge and formalised collaboration models.

It is imperative for both legal professionals and organisations to recognise and address these challenges to fully leverage the potential of emerging technologies while ensuring compliance and ethical responsibility.

FINDING ONE

**Lack Of Clarity In
Laws And Regulations
Regarding Emerging
Technology Poses
Challenges For Legal
Professionals**

FINDING ONE:

Lack Of Clarity In Laws And Regulations Regarding Emerging Technology Poses Challenges For Legal Professionals

One of the foremost challenges encountered in the domain of emerging technologies is the absence of clear and comprehensive regulatory frameworks, paired with significant uncertainties in existing laws. To support and assist lawyers to effectively address these complex legal issues, it is essential to identify and understand the key challenges relating to regulatory burden that lawyers are experiencing in emerging technologies.

1.1. CHALLENGES

The data analysis, from both the interviews and surveys, revealed that the legal challenges faced by lawyers can be categorised into two primary groups, as follows.

1.1.1. COMPLEXITY OF LEGISLATION

Interview results indicated that in-house lawyers in Australia are challenged by the diverse and complex nature of regulations governing emerging technologies in Australia, which encompass a wide range of legal and regulatory aspects, rules and factors, yet are often drafted without emerging technologies in mind, and therefore lack clear directives.

Lawyers face the task of interpreting and applying an array of domestic standards in fields like data protection, privacy and cybersecurity to new technologies, in the absence of specific legislative guidance. Furthermore, emerging technologies often operate

across borders, adding another layer of complexity.

Lawyers must deal with the intricacies of international regulations and standards, which can vary significantly from one jurisdiction to another. This includes tasks such as ensuring compliance and safeguarding data protection across various international legal landscapes.

This legal landscape for emerging technologies is then further complicated by the inconsistencies between state laws within a single country, requiring lawyers to advise on risk mitigation across the various landscapes while ensuring compliance

with multiple, sometimes conflicting, legal frameworks.

Figure 1. displays the responses to a question on addressing legal concerns encountered when advising clients on emerging technologies. Respondents could choose multiple responses, in appreciation of the diverse nature of legal challenges in this context.

Notably, 78% of respondents indicated that their most significant legal concern relates to the absence of applicable rules or regulations when providing advice on emerging technologies.

1.1.2. ABSENCE OF PRECEDENT AND RELEVANT LAWS IN AUSTRALIA

It was identified that lawyers in Australia face a lack of precedents and specific laws for emerging technologies, particularly in areas like data privacy, liability and human rights implications.

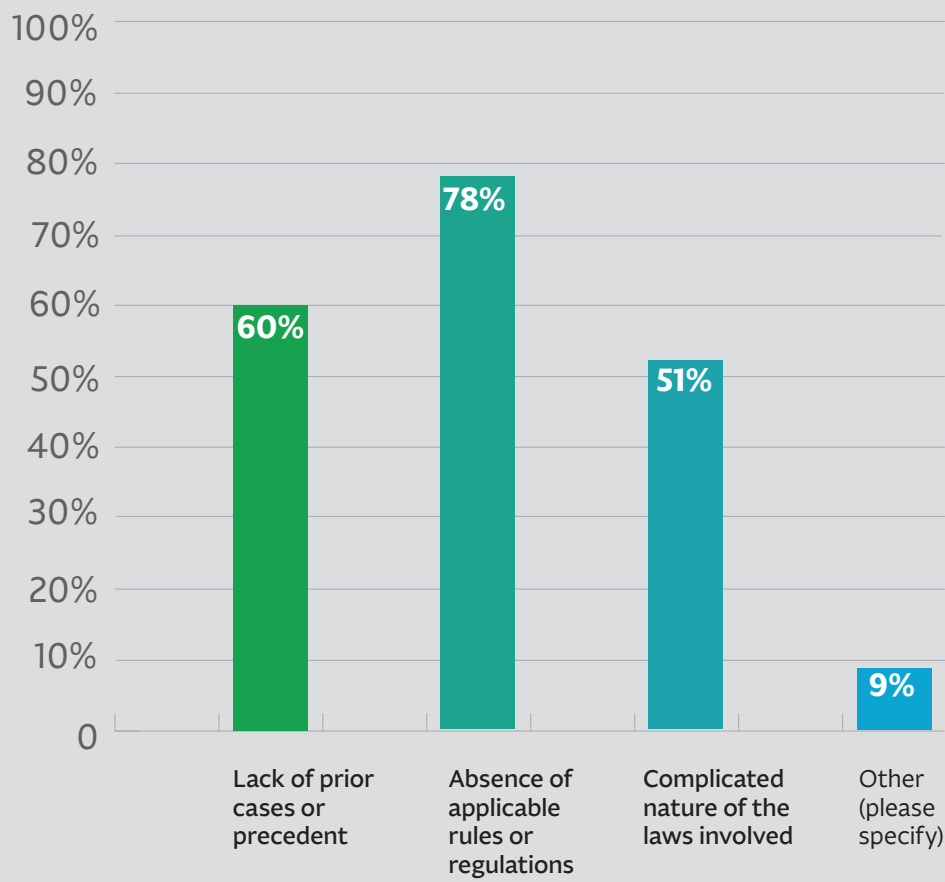

This legal gap becomes more apparent in situations such as virtual healthcare, where privacy and duty of care issues are new and undefined. Moreover, lawyers face difficulties in

addressing human rights concerns, including surveillance and potential discrimination in AI algorithms, due to unclear legal frameworks.

The absence of concrete legal guidance compels these professionals to depend on their own expertise, research abilities, and broad understanding of relevant laws to navigate these uncharted and complex technological areas.

As portrayed in Figure 1. on the next page, the survey revealed that 60% of respondents expressed concerns over the absence of prior cases or legal precedents in the realm of emerging technologies, underscoring the reality that legal professionals often operate without established legal guidance in these areas.

FIGURE 1.
Legal Concerns Encountered When Advising Clients
on Emerging Technologies

1.2. RECOMMENDATION: STRENGTHENING LEGAL INFRASTRUCTURE VIA PROGRESSIVE DEVELOPMENT OF LEGAL FRAMEWORKS AND REGULATORY PROFICIENCY

Based on insights from both qualitative interviews and quantitative survey data, a set of recommendations termed ‘Strengthening Legal Infrastructure via Progressive Development of Legal Frameworks and Regulatory Proficiency’ is proposed, to assist lawyers in addressing the complex legal challenges posed by emerging technologies.

These recommendations advocate for the development and enhancement of legal infrastructure and the acquisition of necessary skills to navigate it effectively.

This involves improving legal systems to better accommodate the rapid evolution and integration of new technologies.

It encompasses the creation and refinement of laws and regulations that strike a balance between flexibility and strength to effectively govern complex technological advancements, such as artificial intelligence, blockchain and biotechnology.

Continuous learning is also essential to enable lawyers to effectively address the unique challenges posed by these technologies and to stay current with

regulatory changes and the evolving legal system in response to new societal and technological challenges.

The recommendations also comprise interconnected actions that collectively contribute to legal clarity and regulatory proficiency.

➤ **Advocate for Clear Regulatory Frameworks:**

Establish specialised legal groups comprising experts in law, technology and policy to proactively address legal gaps posed by emerging technologies. These groups can work collaboratively to draft guidelines, propose legislation, and develop clear legal frameworks around privacy, liability and human rights concerns related with technology.

➤ **Enhance International Regulatory Expertise:**

Strengthen legal knowledge regarding international regulations and cross-border complexities. Given the global nature of technology, a deep understanding of international laws is essential.

➤ **Promote Consistency in State Laws:**

Guide clients to align technology initiatives with state-level regulations, ensuring consistency and mitigating jurisdictional risks.

➤ **Facilitate Case Studies and Knowledge-Sharing:**

Promote the sharing of successful case studies and legal strategies for tackling emerging technology challenges through legal publications, webinars and conferences to disseminate knowledge within the legal community.

➤ **Strengthen Government Engagement:**

Collaborate with government bodies and agencies to provide input on the development of technology-related policies and regulations, shaping legal frameworks for emerging technology challenges.

FINDING TWO
Lawyers Struggle
With Ethical
Risks In Emerging
Technology Advice

FINDING TWO:

Lawyers Struggle With Ethical Risks In Emerging Technology Advice

Data from the interviews and surveys unveiled a complex landscape for lawyers advising on the ethics of emerging technologies. There are a range of ethical considerations that lawyers must contemplate, from data handling and privacy concerns to maintaining professional integrity while aligning with business objectives.

2.1. CHALLENGES

The identified challenges can be categorised into two distinct groups: (1) 'Big Data' ethics; and (2) the balancing of professional ethics with business compliance.

2.1.1. CHALLENGE OF BIG DATA ETHICS

In-house lawyers face significant challenges when advising organisations on ethical issues related to data collection, analysis and use. They must navigate the ethical implications of accessing and using large data sets, ensuring adherence to principles like informed consent, transparency and responsible usage.

Additionally, lawyers are tasked with aligning organisational data practices with human rights laws, addressing concerns such as privacy, non-discrimination and freedom

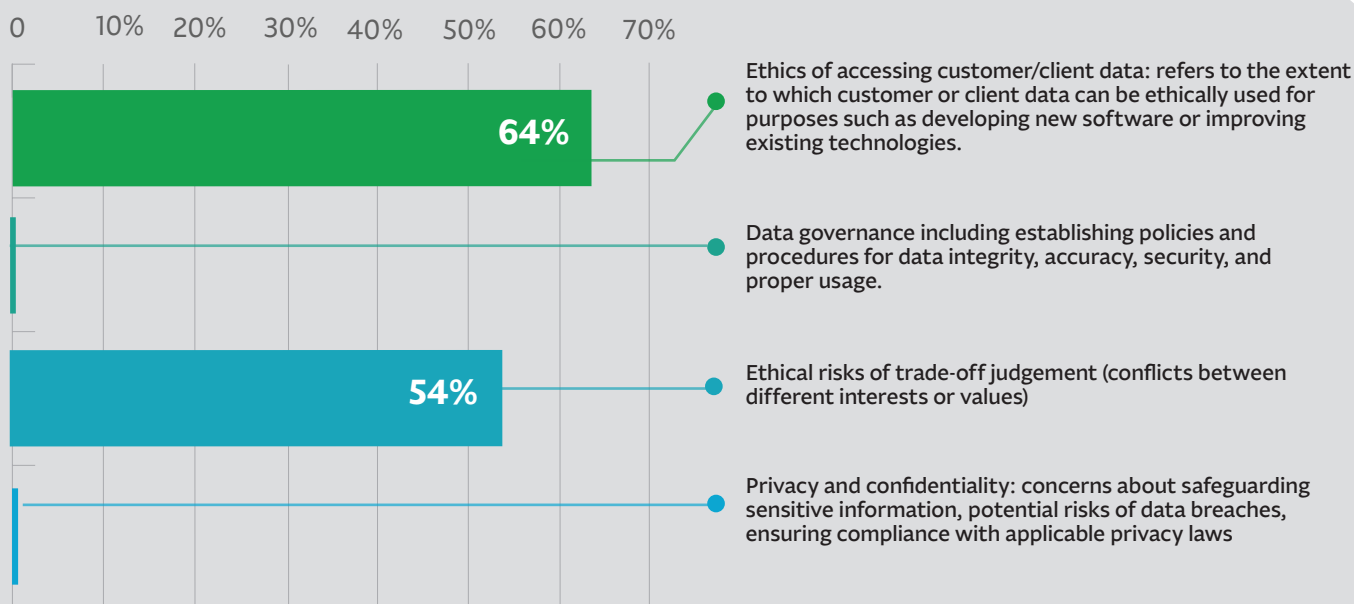

of expression. Some participants highlighted that big data often contains sensitive and personal information, leading to concerns relating to privacy and confidentiality. Organisations must address these concerns proactively to minimise data breaches, unauthorised access and violations of trust.

These challenges underscore the critical role of lawyers and legal guidance in managing the ethical complexities inherent in big data within organisations.

From the surveys, the predominant ethical concern reported by respondents was around issues relating to accessing customer or client data (64%). This suggests that many legal professionals are dealing with ethical questions regarding data usage for purposes like software development or technology improvement.

These findings are presented in Figure 2. below, with respondents, once again, able to select multiple responses.

FIGURE 2.
Ethical Concerns Encountered when Advising Clients on Emerging Technologies

2.1.2. ETHICAL CHALLENGE IN BALANCING PROFESSIONAL ETHICS AND BUSINESS COMPLIANCE

Lawyers are navigating ethical dilemmas when advising organisations on legal matters that intersect with business practices.

Based on the data, it appears lawyers face challenges in addressing situations where business practices may be seen as unethical or potentially illegal, like deceptive marketing, especially in the context of emerging technologies.

They need to strike a balance between promoting ethical, compliant

business practices and supporting the organisation's pursuit of profit.

They also face scenarios where the organisation's goals clash with their own ethical duties and professional obligations, this can require them to advocate for ethical conduct and guide the organisation towards legal and ethical compliance.

As also shown in Figure 2., 54% of those surveyed indicated the ethical risks of trade-off judgment as a major

ethical challenge. This highlights the complexity of ethical decisions when balancing different interests or values in the context of emerging technologies.

2.2. RECOMMENDATION: PROMOTING ETHICAL AWARENESS AND ACCOUNTABILITY IN PROFESSIONAL PRACTICES

A set of recommendations on 'Promoting Ethical Awareness and Accountability in Professional Practices' has been introduced, which are considered essential for today's rapidly evolving tech landscape, where lawyers often face ethical dilemmas that are not fully addressed by existing legal frameworks.

The recommendations encompass a series of interconnected actions, such as the need for ethical awareness, data governance, and ethical considerations throughout the technology adoption process.

Additionally, they highlight the role of lawyers in fostering an ethical decision-making culture within

organisations and encourage their active participation in shaping ethical frameworks.

➤ **Develop Awareness of Ethical Issues in Emerging Technology:**

Cultivate awareness among lawyers of the ethical challenges in emerging technology. This awareness is crucial for making informed decisions that align with both legal and moral standards.

➤ **Promote Ethical Data Governance:**

Ensure due diligence on ethical aspects, data protection, and tech-law expertise in technology projects to uphold ethical standards.

➤ **Emphasise Ethical Considerations:**

Prioritise due diligence on ethical aspects, data protection, and technology-law expertise in technology-driven projects to uphold ethical standards.

➤ **Fostering a Culture of Ethical Decision-making:**

Encourage lawyers to resolve conflicts between business goals and ethics, upholding both legal and ethical standards to foster an ethical organisational culture. By achieving this, technology adoption can then align with ethical norms.

➤ **Encourage Ethics Committee Participation:**

Advocate for legal professionals to actively participate in ethics committees within their organisations to help shape ethical frameworks for technology adoption. Their legal expertise and ethical awareness make them valuable contributors to the development of guidelines that promote responsible and ethical technology practices within the organisation.

FINDING THREE
**Absence Of A
Unified Approach In
Lawyers' Practices
When Navigating
Challenges
In Emerging
Technology**

FINDING THREE:

Absence Of A Unified Approach In Lawyers' Practices When Navigating Challenges In Emerging Technology

The research responses revealed that lawyers lack a holistic approach when it comes to providing advice on issues arising from emerging technology. Based on these data from both interviews and surveys, three main approaches have been identified for when lawyers are confronted with new emerging technology challenges: (1) examining contracts comprehensively to seek remedies; (2) conducting root cause analysis; and (3) seeking external knowledge resources and support.

3.1. CHALLENGES

3.1.1. OVERRELIANCE ON CONTRACTUAL SOLUTIONS APPROACH FOR ADDRESSING CHALLENGES IN EMERGING TECHNOLOGIES

The lawyers who specialise in contracts placed substantial emphasis on the legal aspects of contracts involving emerging technologies, yet they face notable challenges.

While possessing a profound understanding of contract law, negotiating, and drafting contracts with customised remedies and

provisions for technology-related matters can be intricate.

It requires not only a deep understanding of contract law, but also a comprehensive understanding of the technology involved.

This combined expertise is essential for resolving disputes and ensuring that legal solutions are in sync with the

technological nuances, highlighting the importance of adapting legal strategies to the changing landscape of technology.

3.1.2. DIFFICULTIES IN THE PRACTICE OF ROOT CAUSE ANALYSIS APPROACH

In addressing legal challenges associated with emerging technologies, lawyers employ root cause analysis, mainly through two approaches.

First, they analyse privileged reports, using protected documents to strategically understand and address

the root causes of tech-related disputes.

Second, they conduct investigations of all contributing factors, enabling them to pinpoint underlying issues and formulate strategies to mitigate future risks.

This systematic examination is seen as crucial for effectively navigating the complex legal landscape of emerging technologies.

3.1.3. CHALLENGES IN THE NECESSITY OF SEEKING ASSISTANCE FROM EXTERNAL KNOWLEDGE RESOURCES AND SUPPORT APPROACH

The lawyers who are dealing with emerging technology challenges reported that they are increasingly turning to external knowledge and resources to bridge gaps in their understanding and capabilities.

They explore how similar legal matters have been previously handled in

different jurisdictions, especially in the EU and the US, for broader insight and to adapt their own strategies accordingly. Additionally, they expand their teams by incorporating specialised lawyers in technology law, and actively engage in online research to stay up-to-date on the latest legal developments.

As part of their current practices, lawyers might also actively explore innovative legal approaches to handle emerging technology challenges, meaning they are not just relying on traditional legal methods, but are actively adopting creative, technology-driven novel solutions.

For example, they may research and implement novel legal frameworks to address new tech-related issues such as vehicle accidents involving semi-autonomous vehicles, specifying responsibilities for the manufacturer, the owner, and the technical system.

Participants also reported sharing and engaging in advocacy efforts to educate lawmakers and the public about these novel legal frameworks.

All of these approaches are taken because there is no systematic framework or approach that lawyers can uniformly employ when advising on new emerging technology challenges.

This lack of uniformity is evidenced in Figure 3³, with lawyers having reported on various methods and approaches used for addressing the challenges and opportunities presented by emerging technology.

It is seen that only 24% of respondents employ a 'formal approach' when addressing such issues, while the majority follow other, less formal, or even unstructured frameworks.

FIGURE 3.
Addressing Emerging Technology Challenges and Opportunities

³Ad hoc: An informal process, requiring me to act using my best judgment and skills, Systematic: An organised and structured approach, which I follow consistently while applying organisational policies and guidelines, Formal and optimised: A comprehensive and detailed approach that is actively improved over time.

3.2. RECOMMENDATION: PROMOTING INNOVATION AND LEARNING CULTURE

The findings indicate a lack of holistic and systematic approach in legal advisory practices relating to emerging technology. To bridge this gap and elevate lawyers' proficiency in this domain, it is recommended that an 'Innovation and Learning Culture' be cultivated. This will help guide lawyers in this space by promoting innovative thinking and continuous learning as fundamental elements of their professional development.

➔ Foster Continuous Learning Culture:

Promote a culture within legal departments that values ongoing learning and curiosity, keeping lawyers updated on technological advancements and legal developments. This can be achieved through regular training sessions such as Continuing Professional Development (CPD) tailored to issues surrounding emerging technologies, as well as other workshops and access to educational resources.

➔ Provide Accessible Tech Information Hubs:

Ensure lawyers have access to tech information hubs so they may fully explore emerging technologies. These hubs would serve as a valuable resource, offering the latest insights, research and best practices in navigating emerging technologies.

➔ Enhance Analytical Skills:

Empower lawyers with analytical skills to encourage proactive problem solving in technology initiatives. This includes training in data analysis, risk assessment and design thinking.

➔ Research New Legal Thinking Skills:

Undertake cross-disciplinary research to determine systematic approaches that lawyers can use to better understand the legal nuances surrounding emerging technology. In particular, how different parts of the legal system, such as regulation, precedent and new technologies, interrelate and evolve over time.

➔ Encourage Industry Participation:

Actively engage lawyers in industry events, panel discussions, forums and workshops focused on emerging technologies to facilitate knowledge exchange and practical learning, keeping legal professionals informed and engaged.

➔ Enhance Current Legal Practices:

Advocate for the enhancement of legal practices through systematic analysis, privileged reports, external expertise, innovation and collaboration with technology professionals to stay relevant in the face of emerging technologies.

FINDING FOUR

**Lack Of Well-Established
Collaborative
Engagement Between
Technology And Legal
Expertise Within
Organisations**

FINDING FOUR:

Lack Of Well-Established Collaborative Engagement Between Technology And Legal Expertise Within Organisations

The absence of robust engagement and collaboration between lawyers and technology experts within organisations was identified as a significant challenge. This signifies a gap in effectively integrating legal expertise into technology-related decision-making and project execution processes. Which, in practice, means that there may not be a formal mechanism for lawyers and technologists to work together harmoniously.

As a result, organisations may face legal and operational risks due to this lack of collaboration between these two critical domains. To address this challenge, organisations should prioritise fostering cross-disciplinary collaboration to ensure that legal expertise is seamlessly integrated into technology initiatives and decision-making processes.

4.1. CHALLENGES

4.1.1. CHALLENGES IN BRIDGING THE GAP BETWEEN IT AND LEGAL TEAMS IN EMERGING TECHNOLOGY ADVISING

Participants reported that fostering a strong collaboration between IT and legal teams, particularly in the context of advising on emerging technology, presents a significant challenge. One that entails ensuring that technology initiatives are developed and deployed with a comprehensive understanding of both technical and legal considerations.

According to the lawyers, achieving this collaborative partnership can be complex, as it involves addressing potential barriers such as differences in language, priorities, and working methods between IT and legal teams. Overcoming these challenges is crucial for lawyers to proactively manage legal risks, ensure regulatory compliance, and uphold ethical standards.

Successfully navigating these complexities would not only reduce the risk of legal disputes and reputational damage, but would also bolster lawyers' confidence, as they receive essential support and insights from IT experts.

In addition, participants reported that regular discussions on emerging technologies, regulatory updates, and associated legal risks are infrequent, impeding the development of a cohesive relationship.

The lack of legal-tech consultations prior to technology implementation runs the risk of non-compliance with laws such as data privacy and intellectual property. Moreover, the necessity for clear and concise communication is paramount. Complicated communication can hinder effective collaboration, often resulting in misunderstandings.

Aligning the objectives of these departments to ensure both legal compliance and technological innovation requires strategic harmonisation of goals for seamless integration.

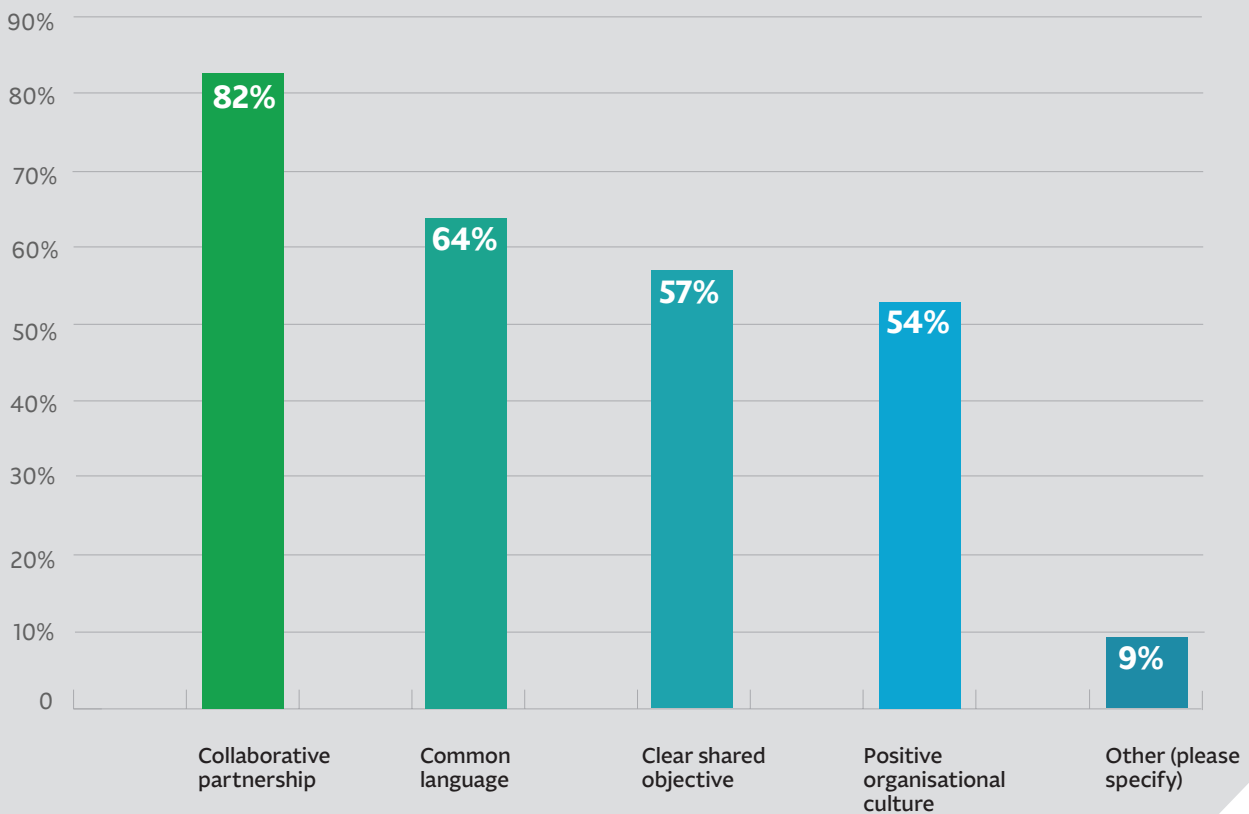

Figure 4. highlights the most critical challenge participating organisations seem to face in fostering proactive collaboration between legal and IT

teams. Indeed, 82% considered a collaborative partnership between lawyers and the technology team to be the strongest indicator of a positive relationship.

This suggests that many respondents view effective collaboration and teamwork between these two groups as a key factor in navigating emerging technologies. Common language was ranked second, with 64% believing shared terminology between lawyers and the technology team is important.

Having clear shared objectives was selected by 57% of the lawyers, and positive organisational culture was chosen by 54%. Notably, the majority of respondents emphasised the importance of all factors, and the necessity for all elements to be present for a positive cross-functional relationship to exist.

FIGURE 4.
Indicators of a Positive Collaboration between Legal and IT Teams

4.1.2. CHALLENGES IN ADDRESSING EXPERTISE DISPARITIES

Participants reported a significant challenge in bridging the disparities and differences between technology and legal expertise, particularly when advising on emerging technology.

Successfully addressing these gaps is crucial for achieving effective collaboration and decision-making within organisations. Contractual misunderstandings can arise from different interpretations, leading to potential legal risks for the organisation.

Varied perspectives between teams often leads to divergent approaches to innovation and risk management.

Disagreements, such as those on data retention for new technologies, underscore the need for collaborative solutions that satisfy both legal and technical requirements.

4.2. RECOMMENDATIONS: COMMUNICATION AND COLLABORATION WITH TECHNICAL TEAMS

Based on these findings, our recommendation 'Communication and Collaboration with Technical Teams', would help to guide lawyers in addressing emerging technology challenges effectively, by bridging expertise disparities and ensuring successful navigation of such challenges within organisations.

➤ Invest in Legal Technologists:

Acknowledge the need for lawyers with expertise in technology-related legal matters who can act as intermediaries to promote efficient communication and collaboration.

➤ Establish Guidelines and Principles:

Develop guidelines and standards that define the tasks and responsibilities of the legal and IT teams in technology projects, outlining communication procedures and addressing legal issues as they arise during the project lifecycle, while keeping organisational goals in mind.

➤ Regular Training and Workshops:

Arrange regular training sessions and workshops for both legal and IT teams to improve their understanding of each other's roles and challenges. And invite external experts or consultants to provide insights and best practices for effective collaboration.

➤ Cross-functional Projects:

Encourage cross-functional projects that require close collaboration between legal and IT professionals. Recognise and reward successful collaboration efforts to motivate teams to work together effectively.

➤ Prioritise Clear and Concise Writing:

Communicate legal concepts and requirements in a way that technology experts can easily understand, using clear and concise writing. This will encourage consistent language use and will improve teamwork and collaboration.

➤ Align Objectives and Goals:

Ensure seamless communication between the legal and IT teams so common objectives, like innovation and legal compliance, can be set, and aims and goals achieved.

➤ Terminology Management:

Avoid misunderstandings and misinterpretations between the legal and technological teams by establishing and using a shared glossary. Implement terminology management tools or software to streamline the process of managing and updating terms. Create an overall framework or playbook to promote clarity and understanding.

FINDING FIVE
**Lack Of Recognition
Of Lawyers' Value
In Enhancing
The Adoption
Of Emerging
Technologies**

FINDING FIVE:

Lack Of Recognition Of Lawyers' Value In Enhancing The Adoption Of Emerging Technologies

Participants reported that the value that they can bring to the technology adoption process is not recognised. They highlighted a lack of clear definition and structure within organisations regarding the role of lawyers in the technology process.

This ambiguity extends to the adoption of emerging technology, leading to uncertainty about when and how lawyers should be involved.

This not only affects the lawyers, but also contributes to low levels of engagement between themselves and

other internal teams. They commented on how the absence of a clear framework results in lawyers being perceived in organisations as either service providers or value adders, depending on the situation.

This variable perception of lawyers can hinder their ability to consistently contribute value in a strategic manner.

Respondents believe they can play a role in changing this perception within organisations, by acquiring better project management skills, which would enable them to actively

participate in various stages of technology adoption.

Additionally, developing competencies in legal technology (tech-law competence) could make lawyers more proficient at handling emerging technology-related legal matters efficiently and effectively. These issues and challenges are further elaborated upon in the following sections.

5.1. CHALLENGES

5.1.1. INADEQUATE GOVERNANCE AND MANAGEMENT STRUCTURES IN EMERGING TECHNOLOGY ADOPTION STAGES

Participants reported that the lack of structured governance and management processes is a prevailing challenge in the adoption of emerging technologies.

This is important because a well-defined governance and management framework is essential for ensuring efficient, compliant and successful technology adoption. It helps organisations navigate the complexities, mitigate risks, and maximise the benefits associated with emerging technologies.

Additionally, a well-defined governance and management framework is also crucial for organisations to be able to fully leverage their internal teams, including the legal team. Indeed, their structured and clear involvement would significantly reduce the potential for future issues and risks in the

adoption of emerging technologies.

This absence of clear guidelines and formal structures is particularly pronounced in various stages of technology adoption, as highlighted by the survey results. Figure 5. summarises the responses given around the governance and management structures and processes implemented in various stages of adopting emerging technology within organisations.

These stages encompass procurement, design, development and deployment. The survey offered three options representing the level of governance and management for each stage: (1) ad hoc; (2) systematic; and (3) formal and optimised².

Few participants reported that their organisations have a formal

and optimised governance and management process across all four stages³ of emerging new technologies.

Significantly, as shown in Figure 5., the highest percentage of respondents described an unstructured and informal governance and management structure for both 'Design,' with 55%, and 'Deployment,' with 52%, stating that these structures are ad hoc.

Based on this data, it is evident that only a small number of organisations have established a formal and optimised governance and management process across all four stages of emerging technologies adoption.

Furthermore, as illustrated in Chart 1. on page 26, the absence of formal structure is not limited to various stages of technology adoption.

²Ad hoc: Informal process, relying on my best judgment skill, Systematic: Consistent and following a structured approach, Formal and optimised: Well-established and systematic process that I am continuously improving.

³ Procurement: Organisation identifies and acquires necessary resources or services such as technology products/services, often involving contracts and legal considerations, Design: Conceptualisation and planning of the technology products/services take place, outlining its functionality and structure, Development: Technology products/services are built and programmed according to the design specifications, Deployment: Implementing the developed technology products/services into the operational environment, making it available for use, Incident Response: Unexpected events, issues, or disruptions related to the technology products/services are identified, addressed and managed.

It also extends to organisations providing guidance⁴ regarding legal practices relating to emerging technologies. 52% of respondents indicated that their organisations offer a moderate level of guidance, which includes having a strategic policy that outlines the need and expectations around legal practices related to emerging technologies.

Only 17% of respondents reported that their organisation provides comprehensive guidance, including a strategic policy, procedures, guidelines,

and routine training that explicitly covers such practices .

There is a significant need for comprehensive guidance by organisations, with it appearing essential for lawyers to have a clear understanding of internal processes and procedures so organisations may effectively navigate the adoption of emerging technologies.

This approach will encourage companies to allocate their legal resources more efficiently, focusing

their in-house legal expertise on high priority strategic matters, while outsourcing routine or less specialised tasks.

This is crucial for ensuring legal compliance, risk mitigation, and benefit optimisation regarding emerging technologies within the organisation. Further, aligning with Finding 3., for lawyers to be effective proactive problem solvers, they must be engaged across all phases, particularly design.

FIGURE 5. Governance and Management Structures at Various Stages of Adopting Emerging Technology within Organisations

⁴ Little or no guidance (i.e., no policies, procedures or training provided), Moderate level of guidance (i.e., a strategic policy that explicitly or implicitly specifies the need and expectations of legal practice relating to emerging technologies), Comprehensive level of guidance (i.e., a strategic policy along with procedures and guidelines backed up with routine training that is explicit about the legal practices relating to emerging technologies).

CHART 1.
Level of Organisational Guidance Provided to Lawyers

5.1.2. ORGANISATIONAL AMBIGUITY SURROUNDING EARLY LEGAL INVOLVEMENT IN TECHNOLOGY ADOPTION

The role of lawyers in enhancing the adoption of emerging technologies in organisations is often underrecognised, despite their potential to offer more than legal compliance, such as risk management and strategic alignment.

The interviews specifically revealed ambiguity in the involvement of in-house lawyers in technology projects. There seems to be debate on their role from the early stages of technology adoption, with opinions divided on whether their participation ensures legal security or adds complexity.

The challenge is therefore to define and acknowledge the specific value lawyers can contribute during the design, development, procurement and implementation of technological solutions.

As shown in Figure 6., the only stage in which 'High Engagement' by lawyers is

noted is regarding 'Incident Response'. This reinforces a view that lawyers are brought in only when things go wrong. The 'Design' phase showed the least engagement, denoting that organisations do not regularly include lawyers at this critical stage.

These findings therefore underscore that organisations tend to emphasise lawyer involvement in the adoption or development of new emerging technologies in the later stages, particularly in deployment and when incidents arise.

Furthermore, the research shows these organisations have typically approached lawyer engagement reactively rather than proactively across various adoption stages, and that there is a clear need to foster proactive engagement, particularly during the design and development phases.

Early legal input in these phases could be instrumental in preventing future legal issues. Regarding the level of engagement between lawyers and other internal teams, such as the IT team, Figure 7⁵. indicates the highest level of proactive engagement was observed during the incident response stage (33%).

In contrast, engagement during the design stage ranked the lowest at 36%, signifying that interaction between lawyers and other internal teams is relatively rare at this stage.

This trend is, in part, a consequence of the previously mentioned lack of systematic governance for the adoption of emerging technologies, resulting in unclear communication and engagement between lawyers and other internal teams.

⁵Rare: Lawyers never or rarely engage during this stage, Reactive: Lawyers engage when they are asked to provide advice, Planned: Lawyers have regular/planned check-ins or meetings with other teams in this stage, Proactive: Lawyers proactively reach out to other teams in this stage.

FIGURE 6.
Engagement in Adopting Emerging Technologies in Organisations

FIGURE 7.
Level of Engagement Between Lawyers and Other Internal Teams Within Organisations

5.1.3. LAWYERS FACING THE CHALLENGE OF BEING PERCEIVED AS SERVICE PROVIDERS RATHER THAN VALUE CREATORS IN ORGANISATIONS

Research responses suggested that the different perceptions of legal teams within an organisation can influence their early involvement. When lawyers are viewed as proactive problem solvers, they are more likely to be included in the initial stages of projects.

Notably, the data showed a striking difference in how lawyers believe their roles are perceived across the organisation. For example, 70% believe the 'Board of Directors' predominantly views lawyers as service providers, focused on identifying risks, with only 30% believing the board sees them as contributors who add value to the adoption of emerging technologies.

This trend is somewhat echoed in 'Professional Services', where 64% of participants reported they believe they are viewed by those in that area as risk-focused service providers.

In contrast, participants reported that teams like 'Business Operations' and 'Executive Leadership' are more inclined to see them as valuable team members who contribute by identifying opportunities in emerging technology, with 54% and 57% respectively perceiving lawyers as risk-focused service providers and 43% and 46% respectively seeing them as value-adding team members.

This disparity in perceptions within organisations illustrates a complex picture of how the role of lawyers is understood in the context of technology adoption.

On one hand, there is a strong inclination to view lawyers through the traditional lens of risk identification and management. On the other, a significant portion of employees recognise the potential for lawyers to add value beyond this traditional role, particularly in identifying opportunities in emerging technology.

Important to note, however, is that the values portrayed in Figure 8. do not represent responses from any other teams about their perceptions of the role of lawyers. The data simply reflects the participating lawyers' own beliefs about how other teams perceive their role.

These results suggest that the potential for lawyers to contribute more strategically and innovatively is perhaps not consistently acknowledged or leveraged – a gap that highlights a need for broader recognition of the evolving role of lawyers in the rapidly changing landscape of technology adoption.

Further, the interview data revealed there is a critical need for organisations to recognise and leverage the strategic value lawyers add, not only in legal advising but also in shaping governance frameworks that support emerging technologies from conception to implementation.

Lawyers are faced with the challenge of transitioning from traditional legal advisors to strategic business engagers. This shift demands broader engagement with technology suppliers, which would see lawyers considering not just the legal but also the technical and strategic facets of vendor relations.

They need to align legal protections with organisational tech strategies while assessing the technical feasibility of technology solutions; a complex task given the intertwined nature of legal, technical and strategic considerations in modern digital transformations.

In fact, based on the interview data, organisations adopting a holistic approach to incident response are more likely to consider the inclusion of legal counsel from the outset as critical. Legal experts assess the legal implications, ensure alignment with laws and regulations, and offer strategic communication guidance.

They provide a long-term perspective, advising on immediate and future consequences of incidents, such as data breaches, including regulatory fines and reputational damage. Legal teams also play a pivotal role in collaborating with suppliers to address liability and contractual obligations, especially in scenarios like product recalls.

They handle insurance claims related to incidents, working alongside providers to secure appropriate compensation for losses. During crisis management,

legal teams coordinate responses with public relations, compliance and operations teams to ensure a unified approach, managing public statements and potential lawsuits.

Legal counsel also identifies and brings in necessary experts, such as IT security specialists and data privacy experts, to address specific incident aspects. They ensure the protection of sensitive information under legal privilege, providing guidance on the confidentiality of communications and documents during investigations.

Lawyers are commonly perceived as risk assessors, which is also suggested in Figure 9. Data shows 94% of organisations primarily engage lawyers when assessing potential risks and challenges associated with emerging technology adoption.

Security and data privacy concerns relating to adopting emerging technology (85%) also encourages organisations to involve legal experts. These findings underscore the limits that exist around lawyers being more broadly recognised for their ability to add substantial value and contribute across various aspects of technology adoption.

In conclusion, these findings highlight the critical role of in-house legal teams in organisations' incident-response strategies. However, recognising the potential of involving lawyers in other phases, and changing the perception of lawyers from mere risk identifiers to proactive problem solvers, could bring a higher level of value to an organisation.

FIGURE 8.
Perceptions about Lawyers' Role by Organisational Teams

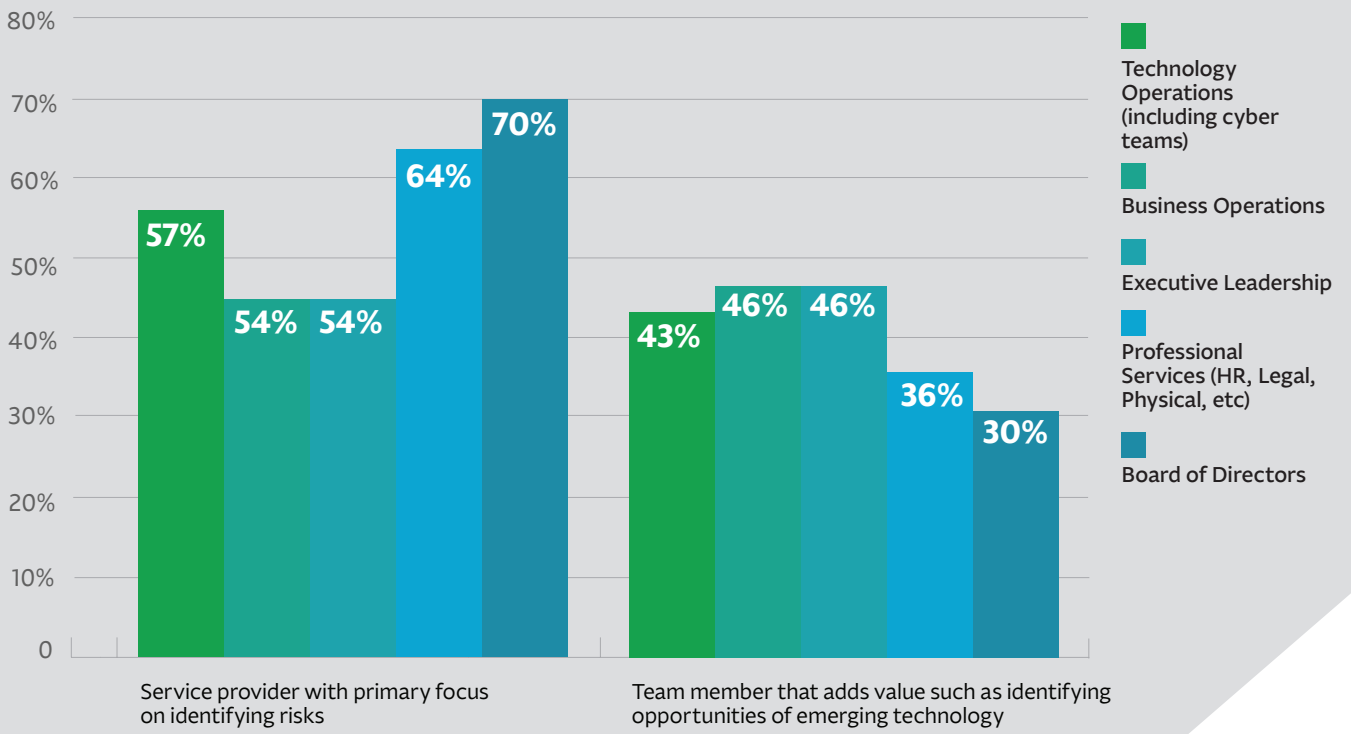

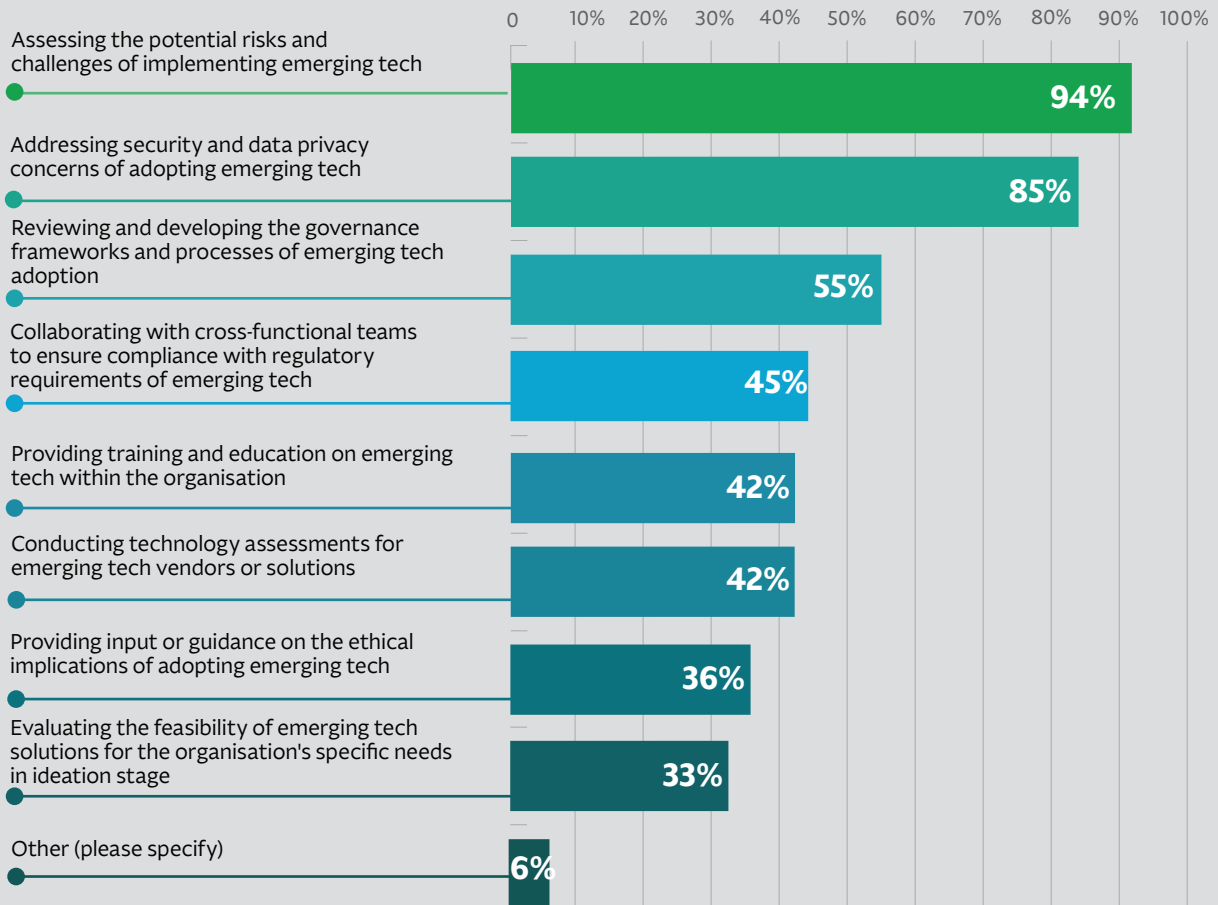

FIGURE 9.
When Organisations Primarily Engage Lawyers in Emerging Technology Adoption

5.1.4. LAWYERS' INABILITY IN SHAPING ORGANISATIONAL PERCEPTION DUE TO AN INADEQUACY IN PROJECT MANAGEMENT SKILLS

Some of the interviewed lawyers noted that they, themselves, could contribute to changing the perceptions within organisations by enhancing their own project management skills.

Taking this action could empower them to actively participate in various stages of technology adoption, with this changing role in project management, especially in technology ventures, necessitating the development of new competencies.

This would include tasks such as formulating risk appetite statements, maintaining continuous project

oversight, and ensuring legal compliance throughout a project's lifecycle. Lawyers could also assist with the challenge of establishing legal frameworks early in the process, ensuring clarity in project expectations, and securing the commitment of all stakeholders to adhere to these guidelines from the project's inception.

Additionally, lawyers must closely collaborate with technologists to seamlessly integrate legal considerations into technology projects from the outset, with the aim

of proactively averting potential legal issues.

This evolving role demands that lawyers align legal and regulatory parameters with project execution while fostering a collaborative relationship with technologists to mitigate potential legal challenges, all while aligning with the organisation's risk tolerance.

5.1.5. DEFICIENCY IN TECH-LAW COMPETENCE POSES A CHALLENGE FOR LAWYERS IN SHAPING ORGANISATIONAL PERCEPTION

Lawyers have the potential to shift organisational perceptions by enhancing their competencies in legal technology, also known as tech-law competence.

This improvement would equip them with the skills needed to efficiently and effectively address legal matters relating to emerging technologies. As lawyers gain a deeper understanding of technology and its legal implications, organisations are more likely to view them as valuable contributors to the adoption of emerging technologies, recognising their ability to provide informed guidance and mitigate potential legal risks effectively.

This shift in perception can lead to a stronger collaboration between lawyers and other internal teams, ultimately driving the successful integration of new technologies.

However, participants reported that their readiness to deal with the intersection of law and technology is hampered by a widespread lack of tech-law competence.

Key challenges identified include a shortfall in practical reasoning skills crucial for applying legal knowledge to emerging technologies, a gap in business education that limits understanding of the impact of technologies on various business aspects, and a deficiency in foundational IT knowledge that is vital for advising on technology-related legal matters and negotiating terms effectively.

Moreover, lawyers face the challenge of staying updated with rapid regulatory changes in the technology sector, essential for providing comprehensive legal advice and safeguarding client

interests in a dynamic business environment.

In summary, the apparent lack of recognition of lawyers' value in the adoption of emerging technologies seems primarily due to the absence of a clear organisational framework for their role. This ambiguity affects both their engagement with other internal teams and their perceived role within the organisation.

Lawyers can actively contribute to changing this perception by enhancing their project management skills and acquiring expertise in legal technology, thereby positioning themselves as valuable contributors in the organisation's technology adoption efforts.

5.2. RECOMMENDATION: STRATEGIES FOR TRANSFORMING LAWYERS' ROLE FROM RISK ASSESSORS TO STRATEGIC CONTRIBUTORS

Changing the perception of lawyers within organisations, from being seen solely as risk assessors to valuable contributors who can identify opportunities in emerging technologies, requires a deliberate and strategic approach.

The following steps and strategies could help facilitate this change and address the challenges highlighted in the findings, enabling organisations and

lawyers to navigate the complexities of technology adoption while recognising and leveraging the valuable contributions lawyers can make throughout the process.

5.2.1. RECOMMENDATIONS FOR ADDRESSING ORGANISATIONAL CHALLENGES FOR ENHANCING LEGAL INVOLVEMENT

➤ **Establish Clear Organisational Frameworks:**

Organisations should develop clear and structured guidelines and/or frameworks for the role of lawyers in technology adoption projects. Such guidelines should outline when and how lawyers should be involved at various stages of technology adoption to ensure legal compliance, minimise risks, and problem solve effectively. This should include clear roles and responsibilities. Creating structured guidelines/frameworks will help eliminate ambiguity and ensure lawyers are recognised for their contributions.

➤ **Leadership Support:**

Organisations' leadership teams should support the changing role of lawyers. These leaders should advocate for the strategic involvement of lawyers in technology projects and communicate the importance of this shift to the entire organisation.

➤ **Proactive Engagement:**

Organisations should promote the proactive engagement of lawyers in technology projects, especially during the design and development phases, and encourage collaboration between all teams so lawyers can identify legal considerations early and prevent potential legal issues.

➤ **Enhance Capital Law Competence:**

Lawyers should be encouraged to increase their tech-law competence. Training and resources should be provided to keep them updated on legal aspects relating to emerging technologies, enabling them to manage technology-related legal matters efficiently and provide informed guidance.

➤ **Change Perceptions:**

Organisations should work to change the perception of lawyers from being solely risk assessors to value creators. They should highlight the strategic contributions lawyers can make in identifying opportunities and aligning technology adoption with organisational goals. This can also be done through education, training sessions, workshops and seminars for both legal and non-legal staff, to increase awareness of the strategic and innovative contributions that lawyers can make in technology adoption.

➤ **Cross-functional Collaboration:**

Lawyers should be encouraged to collaborate closely with other internal teams, such as IT, business development and innovation departments. Examples where lawyers have successfully collaborated on technology initiatives should be highlighted to ensure all employees, not just lawyers, understand the evolving role of lawyers in technology adoption.

➤ **Developing a Feedback Mechanism:**

A feedback mechanism should be established to continuously assess and improve the contributions of lawyers in technology projects. Input should be acquired from different teams and departments on the value lawyers provide, and this feedback used for refinement.

➤ **Measurement of Value:**

The value lawyers bring to technology projects should be quantified in terms of cost savings, revenue generation, and innovation, as well as risk mitigation. Data-driven evidence of their contributions should be provided.

5.2.2 RECOMMENDATIONS FOR ENHANCING LAWYERS' SKILL SETS

➤ **Invest in Project Management Training:**

Lawyers should build on their project management skills, enabling them to actively participate in various stages of technology adoption. This includes skills in risk management, legal compliance, and aligning legal considerations with project goals.

➤ **Develop Tech-Law Competence:**

Lawyers should invest in developing legal technology (tech-law) competence, to gain a deeper understanding of technology and its legal implications, so they may efficiently address legal matters related to emerging technologies.

➤ **Continuous Learning:**

Lawyers should embrace lifelong learning to stay updated with rapid technological changes and legal developments in the tech sector. Organisations should support this by providing access to educational resources and opportunities for skills development.

FINDING SIX

Framework
For Legal
Professionals

FINDING SIX:

Absence Of A Capability Enhancement Framework For Legal Professionals

The findings highlight the need for specialised skills, knowledge and training in navigating the challenges presented by emerging technologies. It is clear that identifying these skills and creating a capability framework is crucial. Lawyers could achieve this through targeted training and workshops, essential for enhancing skills and promoting professional development. This approach would enable them to provide well-informed advice in a technology landscape that is constantly changing. The lack of this specialist skills and knowledge has been significantly noted, underscoring their importance.

6.1. CHALLENGES

6.1.1. LACK OF CULTIVATED SPECIALISED SKILLS

The absence of cultivated specialised skills required by lawyers to effectively address emerging technology issues and navigate complicated legal matters was clear.

There is an obvious need for exceptional crisis management skills, which are important for quick, informed responses and strategic navigation in complex legal environments, particularly under high-pressure scenarios.

This skill set enables proactive risk mitigation and adaptability in the ever-evolving technological landscape, and would help ensure organisations effectively address legal issues.

Another area of concern is the lack of critical legal thinking as a foundational skill. This deficiency hampers lawyers' abilities to analyse complex issues, assess risks, and develop innovative strategies.

Lawyers are often found lacking in the diligence and consideration needed to explore the complexities of technology-related legal matters, which is essential for evaluating immediate and long-term implications of legal decisions.

Further, there is a need for lawyers to cultivate skills for analysing the legal effects of emerging technology, enabling them to identify intricate legal issues.

This involves a careful, comprehensive approach to legal analysis, ensuring no aspect is overlooked in the rapidly evolving tech field.

Overall, cultivating these skills and undergoing specialised training are imperative for lawyers to offer invaluable counsel in the fast-paced and complex field of technology law, and requires further inter-disciplinary research. These competencies are essential for effectively managing legal issues and minimising potential repercussions in this dynamic field.

6.1.2. CHALLENGES DUE TO INADEQUATE TECHNOLOGICAL LITERACY IN LEGAL PRACTICE

The paramount importance of in-house lawyers possessing technological literacy when advising organisations on emerging technologies is evident and is a common theme in the interview data.

Findings revealed a lack of consistent understanding of emerging technologies among lawyers, highlighting varied interpretations and the rapid evolution of tech categories.

Lawyers also face difficulties in understanding the complex nature of technologies like AI, biotech and quantum computing, with their distinct challenges and legal implications. The rapid speed of technological change, such as the shift from novelty to norm

with cloud technology, demands that lawyers continuously adapt their knowledge.

Participants reported that generational and educational disparities can further complicate their ability to stay abreast of these advances, stressing the need for enhanced tech literacy within the legal profession to provide informed advice to navigate these complexities effectively.

Chart 2. on the next page illustrates the challenges lawyers face when trying to understand emerging technologies. A substantial 47% of lawyers find this challenge to be moderate, indicating that it's a widespread issue in the legal

field. In total, approximately 87% of lawyers encounter challenges, whether slight, moderate or extreme.

Only 13% of lawyers reported having no major difficulties, emphasising the challenges lawyers encounter in understanding new emerging technologies. There is clearly a pressing need for enhanced educational resources and training in emerging technologies for legal professionals.

Inadequate tech literacy not only impedes collaboration but also limits lawyers' abilities to foresee ethical and legal implications of technologies such as AI, potentially leading to data privacy issues or misuse, and reduced

CHART 2.
Challenges in Understanding Emerging Technology

FIGURE 10.
Challenging Aspects of Emerging Technology

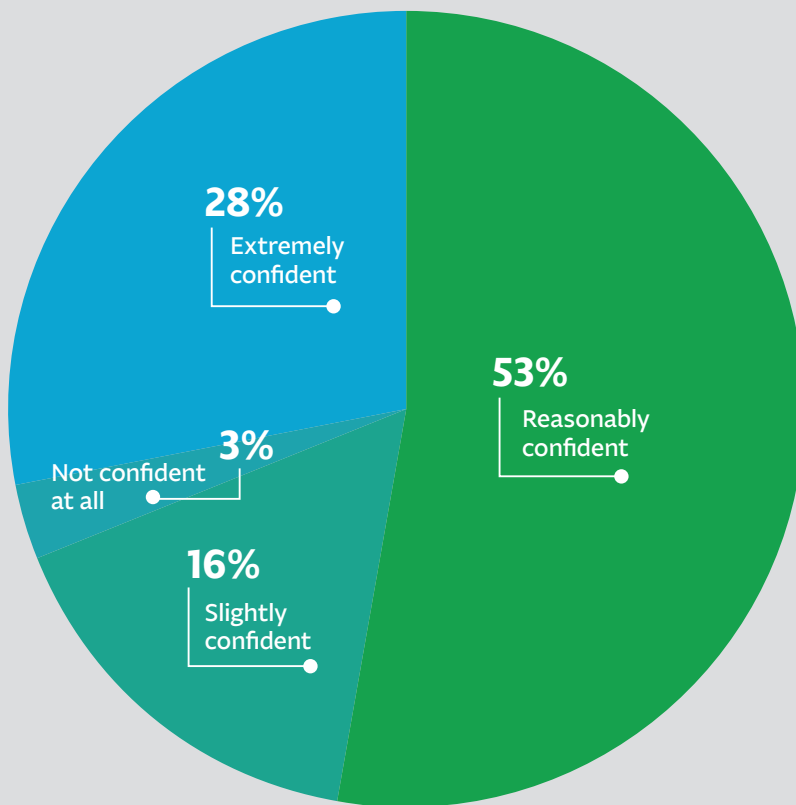

CHART 3.
Confidence in Advising Clients on
Emerging Technologies

value creation from lawyers. Moreover, the unpredictability of future technical capabilities demands that lawyers remain adaptable, ready to address unexpected legal challenges posed by technologies failing to meet objectives or operating beyond their anticipated scope.

Figure 10. on the previous page shows that, when asked about the most challenging aspects of emerging technologies, the highest proportion of responses (51%) indicated that understanding AI and Machine Learning is particularly difficult. Close behind, 45% of respondents reported Quantum Computing as challenging.

Overall, these responses underscore the breadth of challenges faced by lawyers, especially in the realms of Artificial Intelligence and Machine Learning.

Further, participants reported that the integration of emerging technologies into legal practice presents significant challenges, necessitating lawyers to extend their expertise beyond conventional legal issues to include technological competencies.

Significantly, the findings indicate that a lack of self-confidence in handling tech-related legal issues, emerging from insufficient tech understanding, can lead to a reactive approach in legal counsel.

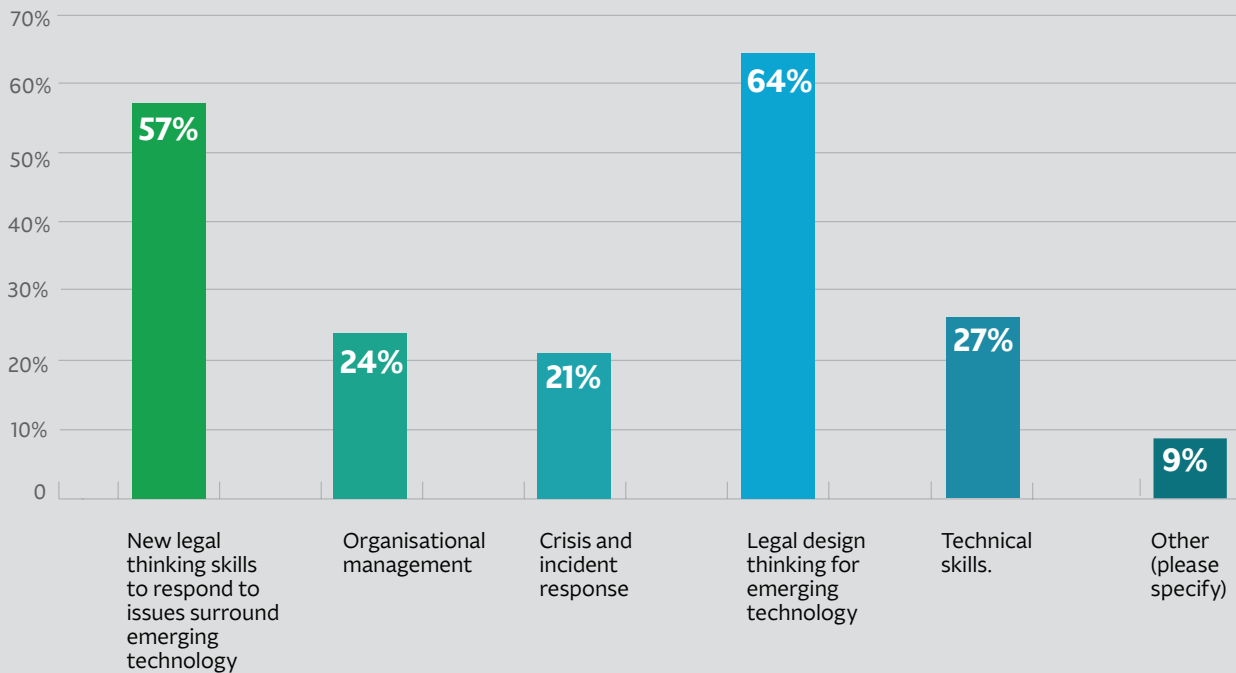

Lawyers must be confident in their ability to identify and address potential legal issues arising from technology, highlighting the importance of continuous skill development and adaptation in the legal profession.

The data also revealed a trend: as lawyers gain a deeper understanding

of emerging technologies, their confidence in providing advice in these areas tends to increase.

Despite most respondents specialising in Technology Law, as shown in Chart 3., only 28% report feeling extremely confident in their advisory capacity. This finding points to a significant confidence gap even among specialists, and underscores the pressing need for comprehensive tech education within the legal sector.

FIGURE 11.
Factors Enhancing Effective Responses to
Legal Challenges in Emerging Technologies

6.1.3. LIMITED AVAILABILITY OF LEARNING STRATEGIES

Findings reveal a shortfall in effective learning strategies for lawyers to be able to address the complexities of emerging technologies, posing a challenge to maintain expertise in a technology-driven legal environment.

A significant gap seems to be the lack of access to practical simulation exercises, essential for hands-on learning in this field, but often unavailable due to limited specialised training and resources.

The absence of specialised academic programs in law schools focusing on emerging technologies further hinders skill development for both new and practicing lawyers, creating a knowledge gap in technology-related legal matters.

Panel discussions on emerging technologies, while insightful, are not universally accessible and require significant time and effort, reducing their impact on the wider legal community.

Moreover, many participants reported that this lack of practical industry experience is due to limited opportunities for hands-on involvement, mentorship or industry-specific workshops.

For instance, a lawyer specialising in cybersecurity greatly benefits from direct interaction with IT security teams, participating in incident response drills, attending relevant conferences, and engaging with experienced mentors. Such immersive experiences are crucial for effectively handling legal issues specific to certain industries and staying abreast of emerging challenges.

The surveys asked lawyers about the factors that contribute to effective responses to legal challenges in emerging technologies.

The leading choices for enhancing capabilities to address legal challenges related to emerging technology as shown in Figure 11, were legal design thinking (64%) and new legal thinking

skills (57%). These skills emphasise the innovative approaches and design thinking principles needed by lawyers to navigate emerging technology challenges.

The need for specialised training in technology-related legal matters is also clear. Legal design thinking involves using design principles to create user-centred and effective solutions to legal issues. New legal thinking skills refer to adopting fresh perspectives and approaches to address complex legal matters posed by emerging technologies.

This reflects a shift towards more creative and strategic problem-solving in the legal field, aligning with the dynamic nature of technology advancements.

6.2. RECOMMENDATION: STRATEGIC INNOVATION AND FUTURISTIC TECHNOLOGICAL PROFICIENCY

The recommended strategic initiative, 'Strategic Innovation and Futuristic Technological Proficiency', is designed to enhance the technological proficiency and advisory capabilities of legal professionals in the evolving landscape of emerging technologies. Central to this recommendation are the following key measures:

➤ **Prioritise Ongoing Technological Education:**

This prioritisation is crucial to ensure lawyers stay updated on new technologies and their legal ramifications.

➤ **Foster Self-confidence and Issue Identification:**

Improving data competence skills, and building cybersecurity expertise, can empower legal professionals to confidently address technology-related legal challenges. This involves not only technical knowledge, but also an understanding of the ethical and legal considerations in the tech space.

➤ **Establish Specialised Training Programs and Workshops:**

Create programs that are specifically tailored to lawyers' needs, covering topics such as IT competency, critical thinking, crisis management, and ethical considerations in relation to legal issues involving technology. Exercises that simulate real-world situations for practical readiness should be included to ensure lawyers can apply their knowledge effectively.

➤ **Implement Standardised Competency Baseline:**

Establish a baseline competency, including technology certifications and regulatory knowledge, to ensure legal professionals are well-equipped and prepared for this rapidly changing area. This can involve industry-recognised certifications and ongoing assessments to maintain competency.

➤ **Mandatory Technology**

Training: Implement mandatory technology training programs for all legal professionals, ensuring that everyone possesses a foundational understanding of technology and its legal implications.

➤ **Establishing Legal Tech Hackathons:**

Organising legal tech hackathons to bring together legal professionals, technologists, and other external stakeholders such as startups or university students. During these hackathons, teams can work on solving real legal challenges using technology. This would help foster a culture of innovation and encourages lawyers to think creatively and collaboratively to develop practical solutions to emerging technology-related legal issues. It could also lead to the development of new tools or approaches to enhance the legal department's efficiency and effectiveness. Additionally, it provides an opportunity for legal professionals to engage with the broader tech community, promoting knowledge exchange and fresh perspectives on legal tech solutions.

The background of the page is a solid blue color with a complex, white, abstract pattern of lines and circles that resembles a circuit board or a network diagram. The lines are of varying thickness and connect various circular nodes of different sizes. The pattern is more dense and intricate on the right side of the page, tapering off towards the left.

C. Conclusion

C. Conclusion

In summary, the Ninian Stephen Law Program's 'New Legal Thinking for Emerging Technologies' offers a comprehensive and enlightening perspective on the current landscape in which lawyers operate within organisations, particularly in dealing with the myriad of challenges and opportunities presented by emerging technologies.

Through a mixed-methods approach involving interviews, surveys and in-depth analysis, the project uncovered valuable insights leading to key findings that are significant for reshaping the legal profession in the digital age. These findings underscore a stark contrast between the potential contributions that lawyers can make and the actual level of engagement they currently experience.

Emerging technologies inevitably bring forth complex ethical and legal questions, ranging from data privacy and cybersecurity to intellectual property rights and liability concerns. In this context, lawyers assume an important role in addressing these multifaceted challenges to ensure organisations navigate the technology landscape responsibly and within the legal boundaries.

However, the unfortunate reality is that lawyers and organisations appear to be ill-equipped to face the future, with lawyers frequently finding themselves marginalised within organisations, often unintentionally excluded from pivotal decision-making processes.

Many participants report lacking the collaborative relationships necessary

for effective problem-solving and are often introduced to the technology adoption process too late to make a substantial impact. This disconnect is further exacerbated by organisational structures that tend to be fragmented, a lack of clear guidance on lawyers' roles, and common misconceptions about their capabilities within the sphere of emerging technologies.

Many organisations tend to undervalue what lawyers can truly bring to the table, primarily regarding them as risk identifiers rather than recognising their potential as strategic partners capable of identifying opportunities, ensuring legal compliance, and contributing significantly to innovation and growth. This limited perspective results in organisations missing out on fully leveraging the expertise and potential of their legal teams, leaving valuable insights untapped.

Moreover, lawyers themselves encounter a series of challenges, including a lack of specialised skills and knowledge in technology-related legal matters, with limited access to training and resources, and a pervasive perception that they may not fully comprehend the complexities of emerging technologies. These challenges often hamper their ability to proactively engage and contribute effectively to technology adoption initiatives.

The data derived from this extensive research underscores clear opportunities for improvement, pointing toward the possibility that, with the right guidance, support and structural changes within organisations, lawyers can assume a

more significant and strategic role in the technology adoption process.

Furthermore, the research brings to the forefront the crucial importance of lawyers in addressing the ethical and legal challenges that emerge alongside technological advancements. This project promotes a vision in which lawyers act as watchful guardians, diligently staying informed about technological progress, ensuring compliance with legal regulations, and actively promoting ethical and legal considerations in technology adoption.

Their capacity for interdisciplinary collaboration with technologists and policymakers is paramount, as it facilitates effective communication and the seamless integration of legal and ethical dimensions into technology projects. Lawyers are instrumental in mitigating risks, safeguarding organisations from legal disputes and reputational damage, and through education and advocacy, they can actively contribute to responsible and ethical technology adoption, thereby helping to shape the future of innovation.

To bridge the gap between the potential and reality of lawyers' contributions, organisations should consider implementing a multifaceted approach. This includes providing clear guidance, enacting comprehensive policies, streamlining procedures, and equipping legal teams with the necessary supporting processes and tools. Such measures can empower lawyers to become more proactive, confident, and deeply engaged in technology adoption initiatives.

Additionally, fostering a culture of cross-functional collaboration, offering specialised training programs, and actively encouraging knowledge-sharing within the legal profession can equip lawyers with the skills and knowledge needed to excel in the dynamic and ever-evolving realm of emerging technologies.

In conclusion, these findings and data collectively offer a revolutionary discovery of the relations and interactions within organisations concerning the role of lawyers in emerging technology adoption. This serves as a fundamental starting point for meaningful conversations and actions aimed at optimising the relationship between legal professionals and their technology counterparts.

By addressing the identified challenges, implementing recommendations, and capitalising on the opportunities, organisations can unlock the full potential of lawyers and create a more collaborative and innovative environment that benefits both legal teams and the organisation as a whole.

This approach will not only enhance the integration of emerging technologies, but will also significantly contribute to responsible and ethical technology adoption within organisations and society at large. It marks a crucial step towards a future where lawyers play a central and transformative role in shaping the ethical and legal dimensions of technology-driven progress.

The benefits of this future scenario are numerous, as it promotes responsible, ethical and legally compliant technology adoption, reduces legal risks, fosters innovation and collaboration, positive outcomes for organisations, and ultimately ensures the protection of individual rights and societal well-being.
